Aim: (3.1) Write a program to replace substring with other substring in the given string.

```
class Practical_3a{
	public static void main(String[] args){
		String org_sent = "Hello my name is Mr. Robot";
		System.out.println("Original Statement: " + org_sent);
		String mod_sent = org_sent.replace("Robot", "Java");
		System.out.println("Modified Statement: " + mod_sent);
	}
}
```

Output:

```
[shn@netbook Practical_3]$ java Practical_3a.java
Original Statement: Hello my name is Mr. Robot
Modified Statement: Hello my name is Mr. Java
[shn@netbook Practical_3]$
```

Aim: (3.2) Write a program that sorts given into alphabetical order

```
import java.util.Arrays;

class Practical_3b{
	public static void main(String[] args){
		String org_str = "fdbeca";
		System.out.println("Original String: " + org_str);
		char[] str_arr = org_str.toCharArray();
		Arrays.sort(str_arr);
		String sort_str = new String(str_arr);
		System.out.println("Sorted String: " + sort_str);
	}
}
```

Output:

```
[shn@netbook Practical_3]$ java Practical_3b.java
Original String: fdbeca
Sorted String: abcdef
[shn@netbook Practical_3]$
```

Aim: (3.3) Create a String Buffer with some default string. Append any string to ith position of original string and display the modified string. Also display the reverse modified string.

```
class Practical_3c{
	public static void main(String[] args){
		StringBuffer str_buff = new StringBuffer("practical3");
		System.out.println("String Buffer: " + str_buff);
		str_buff.append(" modified");
		System.out.println("After Appending: " + str_buff);
		str_buff.reverse();
		System.out.println("Reversed string Buffer: " + str_buff);
	}
}
```

Output:

```
[shn@netbook Practical_3]$ java Practical_3c.java
String Buffer: practical3
After Appending: practical3 modified
Reversed string Buffer: deifidom 3lacitcarp
[shn@netbook Practical_3]$
```
